G. Complex: An immunoglobulin heterotetramer subunit consists of two identical light (kaj facomplex: An immunoglobulin heterotetramer subunit consists of two identical light (kaj haid disulfide bonds. In some cases, such as IgA and IgM, the subunits associate into le Superfamily: immunoglobulin V region; immunoglobulin homology

G. Keywords: autoantipody; chronic lymphocytic leukemia; heterotetramer; immunoglobulin P;1-20/Domain: signal sequence #status predicted <SIGs

A;Title: Autcantibody-associated kappa light chain variable region gene expressed in chr
A;Reference number: PL0021; MUID:88171307; PMID:3127527
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                A, Accession: PL0022
A, Molecule type: mRNA
A, Residues: 1-129 < KIP>
C, Comment: The protein is one of the surface immunoglobulin M autoantibodies expressed

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                      US-10-041-860-48

(AMGE-) AMGEN INC

Oliner JD;

WPI; 2003-504963/47.

New specific binding agents (i.e. anti-Angiopoietin-2 antibodies), useful for inhibiting undesired angiogenesis, or treating e.g. cancers, obesity, hemangioma, arteriosclerosis, atherosclerosis or endometriosis.

Claim 1; Page 93; 161pp; English.

The invention relates to a specific binding agent, which comprises at least one peptide selected from any of 62 peptides (ABR55769-830) or its fragment. The binding agents are antibodies that recognize and bind to

```
New anti-TRAIL-R antibodies with activity of inducing apoptosis of cancer cells and without exerting an effect on normal cells expressing TRAIL-Rs nor inducing injury to hepatocytes, for use in therapy of malignant
                                                                                                                                                                                                                                                                                                                  61 AQKFQGRVTMTRDTSISTAYMELSSLRSEDTALYYCVRGFGYSYNYDYYYGMDVWGQGTT 120
angiopojetin-2 (Ang-2). The specific binding agent, particularly the antibody, is useful for inhibiting undesired angiogenesis, traating cancers, inhibiting undesired angiogenesis, modulating or inhibiting Ang-2 activity, modulating vascular permeability or plasma leakage, or treating a disease (e.g. ocular neovascular disease, obesity, haemangioblastoma, haemangioma, arteriosclerosis, inflammatory disease, inflammatory disease, inflammatory disease, inflammatory disease, bone-related disease, or psoriasis) in a mammal. The present sequence represents a heavy chain variable region of an anti-Ang-2
                                                                                                                                                                                                                                                                                                                                     The present invention describes antibodies or their functional fragments that bind to TRAIL-R1 and/or TRAIL-R2. TRAIL-R1 and TRAIL-R2 antibodies have cytostatic and apoptotic activities, and can be used in antibody
                                                                                                                                                                                                                                                                                       9
                                                                                                                                                                                                                                                           9

activation of an RPTR. Also described: (1) pharmaceutical constitutive comprising (1) as an active ingredient and a pharmaceutical carrier. Comprising (1) as an active ingredient and a pharmaceutical carrier. Comprising (1) as an active ingredient and a pharmaceutical carrier. Comprising (1) as an active ingredient and a pharmaceutical carrier. Comprising (1) as the presence of (1) when bound to the RPTK, and instructions for use; (3) a method for treatment of bone and cartilage correlated disorders by administering a composition of (1) to the subject; (4) a method for treating the composition of (1); (5) a method for cartilage correlated disorders by administering a composition of (1); (5) a method for contribution of an artibody which blocks ligand-dependent activation of RPTK; (6) an antibody which blocks ligand-dependent activation of RPTK; (6) an antibody which blocks ligand-dependent activation of RPTK; (6) and (9) host cells transformed with the vector. (1) have calls call disorders and ophthalmological activities, and can be used correlators disorders including skeletal disorders such as skeletal disorders disorder (1) and cartilage disorders including skeletal disorders (1) and cartilage disorders including skeletal disorders (1) cartinos ingricans displasia, thanatophoric dysplasia, and cartilage disorders disorders associated with abnormal cartivity, including a heamatoposteic associated with abnormal cartivity, including a heamatoposteic malignant cell proliferative disorders associated with abnormal call carcinoma or mammary carcinoma, tumour formation, primary cull carcinoma or mammary carcinoma, tumour formation, primary cull carcinoma or mammary carcinoma, tumour formation of an explandent cell proliferative disorder may be used for tre
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present

New antibodies which have specific binding affinity for a receptor protein tyrosine kinase (RPTK) and block constitutive activation of RPTK, useful for treating bone and cartilage disorders, or malignant cell proliferative diseases.

Claim 52; Page 19; 122pp; English.

The present invention describes a molecule (1) comprising the antigen binding portion of an isolated antibody which has specific binding of a fifth of the control of an isolated antibody which has specific binding or a fifth of a receptor protein tyrosine kinse (RPTK), particularly for a fifth of a receptor protein tyrosine kinse specific binding or affith of a receptor protein tyrosine kinse and a carial and actival independent and a pharmaceutical compositions comprising (1) as an actival independent activation of the RPTK, and instructions for use; (3) a method for treatment of those and cartilage reagent for detecting the presence of (1) when bound to the RPTK, and instructions for use; (3) a method for treatment of (1) to the subject; (4) a method for treatment of composition of (1); (4) a method for treatment or antibody which blocks Ingand-dependent activation of an antibody which blocks Ingand-dependent activation of RPTK; (6) an antibody which blocks Ingand-dependent activation of RPTK; (6) or closed mucleic acid molecule encoding a Vi-CR3 DBA region and a VH region; (9) vectors comprising a nucleic acid molecule encoding a Vi-CR3 DBA region and a VH region; (9) vectors comprising a nucleic acid molecule of (6) or cost-coptantic, cycostatic and ophthalmological activation of RPTK; (6) or cost-coptantic, cycostatic and ophthalmological activation of RPTK; (7) and (9) host cells transformed with the vector. (1) have

Cost-coptantic, cycostatic and ophthalmological activation of RPTK; (8) and a VH region; (9) weeters including an activation of yaptasis and composition and prolification of acanthosis injeriens dysplasis, than activated and activation of instances and individual and prolificative disease or disorder with describer the composition and prolificative disorder may be associated with the action of a conspicition may also be used for treating or inhibiting conscient, unmour progression (particularly progression of transitional conscient and pendent references and disorder may be used for treating

Sequence 127 AA

```
The present invention describes a protein comprising an immunoglobulin (IG) heavy chain variable (VH) domain and an IG light chain variable (VL) domain. The protein binds a complex comprising a major histocompatibility complex (RHC) and a peptide, does not substantially bind the peptide in the absence of the MHC. The peptide is a peptide fragment of gp100, MUC1, TAX or hTERT. Also described: (1) a pharmaceutical composition comprising the novel protein and a carrier; (2) a cytocxic T cell comprising the novel protein and a carrier; (2) a cytocxic T cell comprising one or more nucleic acids for expressing the Ig that binds a complex having an MHC and peptide, does not substantially bind the MHC in the absence of the MHC; (3) an isolated nucleic acid peptide in the absence of the MHC; (3) an isolated nucleic acid comprising a first segment that encodes the Ig variable domain; (4) a comprising a first segment that encodes the Ig variable domain; (4) a novel protein; (5) a transgenic animal whose genome includes heterologous nucleic acid sequences that encodes the novel protein; (6) identifying the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New protein comprising an immunoglobulin heavy chain variable (VH) domain and an immunoglobulin light chain variable (VL) domain, useful for preparing a composition for treating or preventing a cancerous disorder.

protein that specifically binds the WHC-peptide complex; (7) expressing an antigen-binding protein; (8) ablating or killing a target cell that displays a peptide on a surface MHC molecule; (9) treating or preventing a cancerous disorder in a subject; and (10) detecting an MHC-peptide complex in a sample. A protein of the invention has cytostatic activity, and can be used in gene therapy. The protein is useful for preparing a composition for treating or preventing a cancerous disorder. The present sequence represents the heavy chain of an antibody which binds to an MHC-peptide complex where the peptide component in as peptide fragment of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     for

prostate adenocarcinoma. The invention encompasses 4B5 derivatives with immunologic specificity for antibodies specific for GD2. These derivatives, or antigen binding fragments, comprise regions of the 4B5 CD4 junction and regions spanning the 4B5 CD8. Coher derivatives include Pab, F(ab')2, Fab', scFv and isolated heavy and light chains (see also AAW8845). Polymucleotide fragments (see AAX06591-54) encoding 4B5 cartiolated heavy and light chains (see also AAW8845). Polymucleotide fragments (see AAX06591-54) encoding 4B5 cortises, including vaccinia virus vectors, comprising these and operating a host immune response to cancer. Products of the invention can be used in the detection and treatment of e.g. astrocytoma, cludeful in generating a host immune response to cancer. Products of the invention can be used in the detection and treatment of e.g. astrocytoma, cludedendrogilona, pependymona, medulloblastoma, printitive neural cetodermal tumour (PNET), pancreatic ductal adenocarcinoma, small and large cell lung adenocarcinoma, squamous cell carcinoma, and liver metastases, bronchoalveoarcarcinoma, breast tumours such as ductal and lobular adenocarcinoma, prostatic adenocarcinoma, cholangiocarcinoma of the bladder, B and T cell ymphoma (nodular and diffuse), plasmacytoma, acute and chronic leukemia, malignant melanoma, soft tissue sarcoma and leiomyosarcoma

New antibodies which have specific binding affinity for a receptor protein tyrosine kinase (RPTK) and block constitutive activation of RPTK, useful for treating bone and cartilage disorders, or malignant cell proliferative diseases.

Claim 52; Page 18; 122pp; English

The present invention describes a molecule (I) comprising the antigen binding portion of an isolated antibody which has specific binding ordination of an isolated antibody which has specific binding ordinates growth factor receptor (FGFR), and which blocks constitutive affinity for a receptor protein tyrosine kines (EFFR), particularly for a cutiliary agent; (2) \* kit comprising (I), at least one crivation of an active ingredient and a pharmaceutical compositions comprising for use; (3) a method for treatment of bone and artiliage research for detecting the presence of (I) when bound to the RPFK, and instructions for use; (3) a method for treating or inhibiting a cell proliferative disease or clisolated mucleic caid molecule emodality of (1); (5) a method for recenting an entitle comprising the antigen-binding portion of antibody which blocks Ilgand-dependent activation of RPFK; (6) and WH-comparing the antigen-binding portion of an inhibition antibody which blocks Ilgand-dependent activation of RPFK; (6) or clostated mucleic acid molecule emodaling a VI-CRN 3DNA region and WH-comparing by region; (8) vectors comprising an ancivities, and can be used on an artiforage of socrates of socra

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is a human anti-tumour antigen monoclonal antibody (MAb) heavy chain variable region, useful in medicine, pharmacology and blochemistry. The isotype of a MAb secreted by the human/human hybridoma HT was determined to be mu and kappa. Human MAb was purified, and the antigen recognised by human MAb CLN"-IgM identified by western blotting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                20 QVQLVQSGAEVKKPGASVKVSCKASGYTFTGYYMHWYRQAPGQGLEMMGWINPNSGGTNY 79

This sequence represents the heavy chain of an antibody of the invention. The antibody is a monoclonal antibody (MAD) with an isotype that fixes complement and a variable region that binds to the epitope on CD147 bound by the IGM MAD ABX-CBL, providing that the antibody is not CB11. The MAD can selectively kill activated T-cells, activated B-cells or resting or diseases involving activated T-cells or B-cells or reacting diseases involving activated T-cells or B-cells or monocytes, e.g. graft versus host disease (GVHD), organ transplant rejection diseases (e.g. can all transplant, cancers (e.g. cancers of the blood (e.g. leukaemia's and lymphomas) and panoreatic), autoimmune diseases (e.g. lupus), and inflammatory diseases (e.g. arthritis)
                                                                                                                                                                                                                                                                                                     New monoclonal antibody, used for treating e.g. graft versus host disease, cancers, autoimmune diseases and inflammatory diseases.
                                                                                                                                                                                                                                                                                                                                                    Claim 60; Fig 26; 245pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     셤
                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes a human heterodimeric antibody (I) fragment) having a binding affinity of at least 1x10-8 M to the protective antigen of Bacillus anthracis or a molecule involved in anthrax infection that blocks binding of the antigen or molecule to cell receptors, edema factor and lethal factor. (I) has virucide and antibacterial activities, and can be used in immunotherapy. The antibactive agents, such as anti-toxins or anti-infectives with respect to infective agents, such as anthrax, bornlinum, smallpox, vanezuelan equine encephalomyelitis virus (VEEV), or West Nile virus (WNV). The present sequence represents a human heterodimeric antibody heavy chain which is region amino acid sequence, which is used in the exemplification
                                                                                                                                                                                                                                                                                                        New human heterodimeric antibodies or their antibody fragments, useful as anti-toxins or anti-infectives with respect to infective agents, e.g. anthrax, botulinum, smallpox, Venezuelan equine encephalomyelitis or West Nile virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         61 AQXEQGRVTMTRDISISTAYMELSSLRSEDTAIYYCVRGF-----GYSYNYDYYYGMDVW 115

The present invention describes a molecule (I) comprising the antigen binding affinity for a receptor protein tyrosine kinase (RPTK), particularly for a fibroblast growth factor receptor (FGFR), and which blocks constitutive activation of an active ingredient and a pharmaceutical carrier.

Comprising (I) as an active ingredient and a pharmaceutical carrier.

excipient, or auxiliary agent; (2) a kit comprising (I), at least one carrier to detecting the presence of (I) when bound to the RPTK, and instructions for use; (3) a method for treatment of bone and cartilage comprising the composition of (I) to the subject; (4) a method for treating the composition of (I) to the subject; (5) a method for treating the composition of (I); (5) a method for creating the composition of (I); (5) a method for creating the composition of (I); (5) a method for creating the composition of (I); (5) an instructions for use; (7) and (9) hose ligand-dependent activation of RPTK; (6) an antibody which blocks ligand-dependent activation of RPTK; (6) and a VH region; (7) and (9) hose cells transformed with the vector. (I) have calls transformed with the vector. (I) have (6) or correctly comprising (I) are useful for treating cast and a VH region; (3) and solated mucleic acid molecule encoding VL region and a VH region; (3) and solated mucleic acid molecule encoding VL region and a VH region; (2) and (2) hose and cartilage disorders; including skeletal disorders such as Refer inhibitor. Compositions comprising (I) are useful for treating bene and cartilage disorders; including skeletal disorders such as cannotroplasia, severe achondroplasia, thanatophorate disorder as a RPTK inhibitor. Composition may also be used for treating cast mannary call under Section and a carnical delay and acanthosis ingricans dysplasia or a cranicynostosis disorder (e.g. mannary, colon, cervical, chondroplasia, conference and services and such associated with the action of a constructurely acidated RPTK. The composition may further be associated with the action 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  dependent FGFR signaling, such as vision disorders (e.g. neovascular glaucoma, macular degeneration and proliferative retinopathy including diabetic retinopathy), and non-neoplastic angiogenic pathologic conditions (e.g. haemanglomas, anglofibromas and psoriasis). The present
                                                                                                                                                                                                                                                                                                                                                                               New antibodies which have specific binding affinity for a receptor protein tyrosine kinase (RPTK) and block constitutive activation of useful for treating bone and cartilage disorders, or malignant cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               conditions (e.g. haemangiomas, angiofibromas and psoriasis). The psequence is given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Claim 52; Page 19; 122pp; English

Antibodies against B Lymphocyte Stimulating polypeptides, useful for the diagnosis and treatment of cancers and immune disorders.

Claim 1; Page 2465-2466; 3148pp; English.

This invention describes novel antibodies that immunospecifically bind to B Lymphocyte Stimulator (BLyS) polypeptides: BLyS is a member of the tumour necrosis factor (TNF) super family and induces B cell correction and differentiation. The antibodies of the invention have cytostatic, immunosuppressive, immunostimulant, immunomodulatory, antitheumatic and antiAIDS activity and can be used in vaccines to inhibit the expression and activity and can be used in vaccines to inhibit the expression and activity of BLyS. The antibodies bind to BLyS on seasociated with aberrant expression of BLyS. They may to diagnose disease associated with aberrant expression of BLyS. They may also be amontal to treat diseases associated with aberrant ELyS expression and activity such as cancer, immune, and autoimmune disorders and diseases, e.g. systemic lipus erythematosus, theumatoid arthritis, immunodeficiency (e.g. common variable immunodeficiency (CVID) and acquired immunodeficiency syndrome (AIDS)). ABP43990-ABP47228 represent the interpolates and fragments of the antibodies described in the method of invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a specific binding agent, which comprises at least one peptide selected from any of 62 peptides (ABR55769-830) or its fragment. The binding agents are antibodies that recognize and bind to anglopoietin-2 (Ang-2). The specific binding agent, particularly the antibody, is useful for inhibiting undesired anglogenesis, treating cancers, inhibiting undesired anglogenesis, modulating vascular permeability or plasma leakage, or treating a disease (e.g. ocular neovascular disease, obesity, haemangloblastoma, haemangloblastoma, arteriosclerosis, inflammatory disease, inflammatory disease, inflammatory disease, inflammatory disease,

The present invention describes a molecule (I) comprising the antigen binding portion of an isolated antibody which has specific binding affinity for a receptor protein tyrosine kinase (RPTK), particularly for a tibroblast growth factor receptor (FGFR), and which blocks constitutive activation of an RPTK. Also described: (I) pharmaceutical compositions comprising (I) as an active ingredient and a pharmaceutical carrier,
                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            New antibodies which have specific binding affinity for a receptor protein tyrosine kinase (RPTK) and block constitutive activation of RPTK, useful for treating bone and cartilage disorders, or malignant cell proliferative diseases.
                                                                                                                                                                                                                                                                     120

reagent for detecting the presence of (1) when bound to the RPTK, and reagent for detecting the presence of (1) when bound to the RPTK, and instructions for use; (3) a method for treatment of bone and cartilage related disorders by administering a composition of (1) to the subject; (4) a method for treating or inhibiting a cell proliferative disease or disorder by administering the antigon-binding portion of an antibody which blocks ligand-dependent activation of RPTK; (6) an isolated nucleic acid molecule encoding a VL-CDR3 DNA region; (7) an isolated nucleic acid molecule encoding VL-CDR3 DNA region; (8) vectors comprising nucleic acid molecule of (6) or (7), and (9) host cells transformed with the vector. (1) have controlled transformed with the vector. (1) have cost expands. (2) cost expands (2) and (3) host cells transformed with the vector. (1) have cost expands (2) and (3) host cells transformed with the vector. (1) have cost expands (2) and (3) host cells transformed with the vector. (1) have cost expands (2) and (3) host cells transformed with Anatophoric dysplasia, expression for treating of a propersion of a craniosynostosis of counthosis nigricans dysplasia or a craniosynostosis disorder (e.g. hypochondroplasia, severe achondroplasia with developmental delay and acanthosis nigricans). The composition may also be used for treating or inhibiting malignant cell proliferative disease or disorder associated with abnormal RPTK activity, including a haematopotesic of cranical, chondrosarcoma or osteosarcoma), tumour formation, primary tumour formations and mammary carcinarly progression of transitions and cell carcinoma or mammary carcinarly progression of cell carcinoma or mammary carcinarly dependent formations and further be used for treating constitutively activated RPTK, or with ligand-dependent extraorlar degeneration and proliferative dependent or mammary described with ligand-dependent formations and incorder as sociated with ligand-dependent formations as vision and sociated with ligand-dependent 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                conditions (e.g. haemangiomas, angiofibromas and psoriasis). No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                    US-10-041-860-48

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
